To calculate the buoyancy, we need the volume of displaced water, which is the volume of the ball because it is being held completely submerged. The buoyant force is equal to the weight of that volume of water. That's a lot stronger than the 6.1N downward pull of gravity, so the ball will rise to the surface when released.

Buoyancy (*f* "b ʊ ɔɪ ə n s i , " b u : ] ə n s i /) or upthrust, is an upward force exerted by a fluid that opposes the weight of a partially or fully immersed object. In a column of fluid, pressure increases with depth as a result of the weight of the overlying fluid. Thus the pressure at the bottom of a column of fluid is greater than at the top of the column.
