The main difference between a diesel and gasoline engine is the absence of an ignition system to ignite the fuel mixture. Diesel engines are compression-ignition engines as opposed to spark-ignition, so there are no spark plugs, wires, or ignition coil. Instead, heat generated from compression ignites the air/fuel mixture in the cylinders.

The amount of fuel sprayed is increased or decreased by a mechanical or electrical control unit - in other words, it is just like turning a tap on and off. The other popular system is timed injection (pulsed injection) where the fuel is delivered in bursts to coincide with the induction stroke of the cylinder. As with continuous injection, timed injection can also be controlled either mechanically or electronically.
